

Bottleneck Resource Allocation in Manufacturing: Anantaram Balakrishnan (Classic Reprint)

Excerpt from Bottleneck Resource Allocation in Manufacturing: Anantaram Balakrishnan Many resource-allocation problems in manufacturing and service operations require selecting integer-valued levels for various activities that consume nondecreasing amounts of limited resources. System productivity, to be maximized, is limited by the least productive (bottleneck) activity. We first review a basic bisection method that can solve this discrete, monotonic resource-allocation problem even with nonlinear objective and constraints. We then generalize the basic algorithm to solve an enhanced version of the problem containing additional coupling constraints on the allocation decisions. This generalization applies to assembly-release planning (ARP) in a multiproduct assemble-to-forecast environment with part commonality. The ARP problem requires finding feasible amounts of each product to release for assembly in each period using the available parts. The objective is to maximize the minimum difference between the actual and desired service levels over all products and time periods. We also consider extensions of the ARP model incorporating precedence constraints and part substitutability, and show how to modify the bisection method to solve these problems. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally

left to preserve the state of such historical works.
