

Cellular and Molecular Biology of Plant Seed Development (Advances in Cellular and Molecular Biology of Plants) (Volume 4)

The beginnings of human civilization can be traced back to the time, nearly 12,000 years ago, when the early humans gradually changed from a life of hunting and gathering food, to producing food. This beginning of primitive agriculture ensured a dependable supply of food, and fostered the living together of people in groups and the development of society. During this time, plant seeds were recognized as a valuable source of food and nutrition, and began to be used for growing plants for food. Ever since, plant seeds have played an important role in the development of the human civilization. Even today, seeds of a few crop species, such as the cereals and legumes, are the primary source of most human food, and the predominant commodity in international agriculture. Owing to their great importance as food for humans and in international trade, seeds have been a favorite object of study by developmental biologists and physiologists, nutritionists and chemists. A wealth of useful information is available on the biology of seeds.
